Answers you can prove.

At a regulated company, the same question must get different answers for different people, and nobody should be able to tell what they were not allowed to see.

WHAT IT DOES

- **Answers only from what the asker can open** across Confluence, Jira, Slack and Drive, and cites the exact passage.
- **Two permission gates before the model**, plus a re-check at the source just before release.
- **Keeps a sealed, hash-chained log** of every request, so any change shows up.

TWO PROOFS

Restricted looks exactly like non-existent. Ken asks about a real customer he may not see and about a company that does not exist: the two refusals are identical, byte for byte.
0 differences in 400 paired questions.

Tamper-evident audit. Change one decision in a copy of the log and Verify breaks at that exact entry.

0 / 7,374	0 / 400	1040	124
adversarial requests leaked	restricted vs non-existent differences	backend tests	browser tests (axe included)

Evidence re-run 30 Oct 2026. Synthetic data; Confluence, Jira, Slack and Drive are mock servers with real API shapes. Answers are currently quoted from the sources with the same checks; the Hunyuan Hy3 live run is pending.

BUILT WITH TENCENT

- **CodeBuddy** built and reviewed the code.
- **WorkBuddy** asks through our MCP connector, a second front door.
- **Hunyuan Hy3 via TokenHub** is wired; the live run is pending.
- **Miora** made the cover art.

BUSINESS VALUE (estimate)

≈ US$1.3M a year, base case

600-person fintech, 90 min saved per person per week, US$31/h, 46 weeks. Break-even is about 7 minutes per person per week. A projection, not a measurement; a pilot would measure it.

THE ASK

One pilot team at one regulated company.

Team Walnut · Ishaan · Dev · Mehul · Aaruni
